

# Merging persistence units

## Merging persistence units

Classpath Scanning for @Entity Classes and JPA Mapping Files

Spring supports having multiple persistence units. Sometimes, however, you might want to modularize your application but still make sure that all these modules run inside a single persistence unit. To enable that behavior, Spring Data JPA offers a `PersistenceUnitManager` implementation that automatically merges persistence units based on their name, as shown in the following example:

*Example 1. Using `MergingPersistenceUnitManager`*

```
<bean class="...LocalContainerEntityManagerFactoryBean">
  <property name="persistenceUnitManager">
    <bean class="...MergingPersistenceUnitManager" />
  </property>
</bean>
```

XML

## Classpath Scanning for @Entity Classes and JPA Mapping Files

A plain JPA setup requires all annotation-mapped entity classes to be listed in `orm.xml`. The same applies to XML mapping files. Spring Data JPA provides a

`ClasspathScanningPersistenceUnitPostProcessor` that gets a base package configured and optionally takes a mapping filename pattern. It then scans the given package for classes annotated with `@Entity` or `@MappedSuperclass`, loads the configuration files that match the filename pattern, and hands them to the JPA configuration. The post-processor must be configured as follows:

*Example 2. Using `ClasspathScanningPersistenceUnitPostProcessor`*

```
<bean class="...LocalContainerEntityManagerFactoryBean">
  <property name="persistenceUnitPostProcessors">
    <list>
      <bean
class="org.springframework.data.jpa.support.ClasspathScanningPersistenceUnitPostProcess
or">
```

XML

```
<constructor-arg value="com.acme.domain" />
<property name="mappingFileNamePattern" value="**/*Mapping.xml" />
</bean>
</list>
</property>
</bean>
```

#### NOTE

As of Spring 3.1, a package to scan can be configured on the `LocalContainerEntityManagerFactoryBean` directly to enable classpath scanning for entity classes. See the [JavaDoc](#) for details.
